

## How to understand the workings of the cat-feeding machine

Have you got a feline friend as a pet? Noticed it is NEVER satisfied and ALWAYS purring around your feet for more food? Ever heard yourself grumble, “Again? Seriously? I only fed you an hour ago!” instead of saying, “I’m going to sit on the sofa and have the afternoon to myself doing nothing.”

Well, this machine is what your dreams are made of. No more messing with messy cat food, no more frustrating disruptions and plenty (and I mean plenty) of cat-napping opportunities on your side. Sounds too good to be true...well, read these instructions of how this purrrfect machine works.

### Equipment

- Small wooden see-saw
- Piece of sturdy plastic
- Long, narrow bar (no bigger than 1m)
- Meaty chunks (your cat’s favourite works best)
- Metal clip approximately 5 inches long x 2
- Pipe x 2 (one must be twice as long as the other)
- Rubber bellow
- Balloon –any colour will do
- Piece of plastic
- Milk reservoir filled with milk (whole)
- Bowl

### Instructions:

Before you introduce your cat to the cat-feeding machine, make sure that you are well stocked up on your cat’s favourite food.

1. Firstly, encourage the cat to step on the small, wooden see-saw which will rise up and as a result, push the long, narrow bar upwards.
2. As the bar moves further up, it will push the sturdy piece of plastic, tilting it slightly and creating a gap from the storage container.
3. Once that gap is big enough, the meaty chunks – the cat’s food – will descend down the pipe (this is to ensure that the food is directed accurately into the bowl).

### Top Tip

As this cat-feeding machine is rather complex to set up, we suggest having a few trial runs before expecting your cat to independently use it themselves: patience is definitely required at the start.
